Cybersecurity Incident Report

Section 1: Identify the type of attack that may have caused this network interruption
One potential explanation for the website's connection timeout error message is: The logs show that: at some point the website stopped responding to the real legitimate employees due to the traffic that was made on the web server making them not to connect to the web server for the website. This event could be:DoS(Denial-of-service) SYN flood attack

Section 2: Explain how the attack is causing the website to malfunction
When website visitors try to establish a connection with the web server, a three-way handshake occurs using the TCP protocol. Explain the three steps of the handshake: 1.The client sends a SYN packet to the server to ask for a connection 2. The server replies with a SYN-ACK packet, acknowledging the request and providing its own sequence number 3.The client sends an ACK(acknowledgement) packet back to the server, confirming the link and opening the data stream Explain what happens when a malicious actor sends a large number of SYN packets all at once: it causes traffic on the service(SYN flood attack) and can cause DoS Explain what the logs indicate and how that affects the server: it indicates a red highlight and repeated same IP address/source been used to login and the server refuses to respond to legitimate employees
